

Model 102-A

STAND ALONE READER

Kee Company offers three basic types of off-line card readers, all of which have a high degree of security but some are manufactured to produce a higher level within their own design.

The 102A programmable card reader offers maximum security at an affordable price. It is coded by inserting a code board into the rear of the reader. When ordering a new code the old code board is removed and a new one is inserted into the reader to match the new cards.

The 102A card reader has the capability to accept master and sub-master codes for use with multiple card readers. Also available is a crossover option which enables the user to continue to use the old cards along with the new cards until all of the new cards have been issued.

This reader has a heavy duty micro switch with N/O and N/C contacts which makes it compatible with almost all security applications. The V-4 Kee Cards used with this reader have features that make them virtually impossible to duplicate.

Applications:

- Parking Lots
- Pool Gates
- Pedestrian Gates
- Recreation Rooms
- Laundry Rooms
- Conference Rooms
- Elevator Control
